

The Atlantic Forest is a global Biodiversity Hotspot and one of the most important regions on the planet for primate conservation. Of the 25 species in this pocket guide, 18 are endemic to the Atlantic Forest, including the lion tamarins and muriquis, worldwide symbols of the conservation of endangered species. This region has been colonized by Europeans since the 16th Century, and is currently home to around 70% of the Brazilian population. The forests have been destroyed and fragmented for timber, agriculture, livestock farming, mining, development infrastructure and urbanization, and are now reduced to a very small percentage of their original extent.
